

Understanding Canine Chiari Malformation and Syringomyelia

By Karen Kennedy, RTMR, MappSc

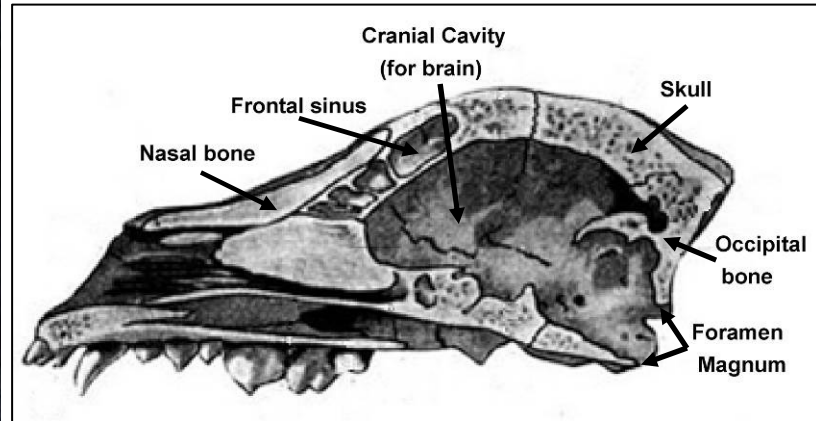

London Health Sciences Centre London, Ontario, Canada

Cavalier King Charles Spaniel Club of Canada

A Chiari Malformation (CM) occurs at the craniocervical junction. This is where the skull and the top of the spine meet. At the bottom of the skull, there is a large hole called the foramen magnum. The foramen magnum allows the brainstem to exit the skull and become the spinal cord.

Inside of skull from the side

When the lower lobe of the brain, the cerebellum, is displaced to the level of the foramen magnum (mild CM) or through the foramen magnum (severe CM) there is overcrowding in the foramen magnum. This causes obstruction of the normal flow of CSF from the brain down to the spinal cord. Many dogs with CM develop syringomyelia (SM). Syringomyelia is a condition where cavities, or holes, called a syrinx, develop within the spinal cord.

Simplified Anatomy and Function of the Spinal Cord

Grey and White Matter

The spinal cord is made up of grey and white matter. Using a computer network as an analogy, the grey matter can be thought of as the actual computer, whereas the white matter represents the network cables connecting the computers together.¹

Grey matter - central "butterfly" shaped area of spinal cord containing neurons

White matter - tissue through which messages pass between different areas of grey matter

Spinal Pathways

Ascending (located in dorsal horn)
- sensory information
(e.g. Pain, touch, temperature)

Descending (located in ventral horn)
- motor (movement)

Effects of a Syrinx Simplified

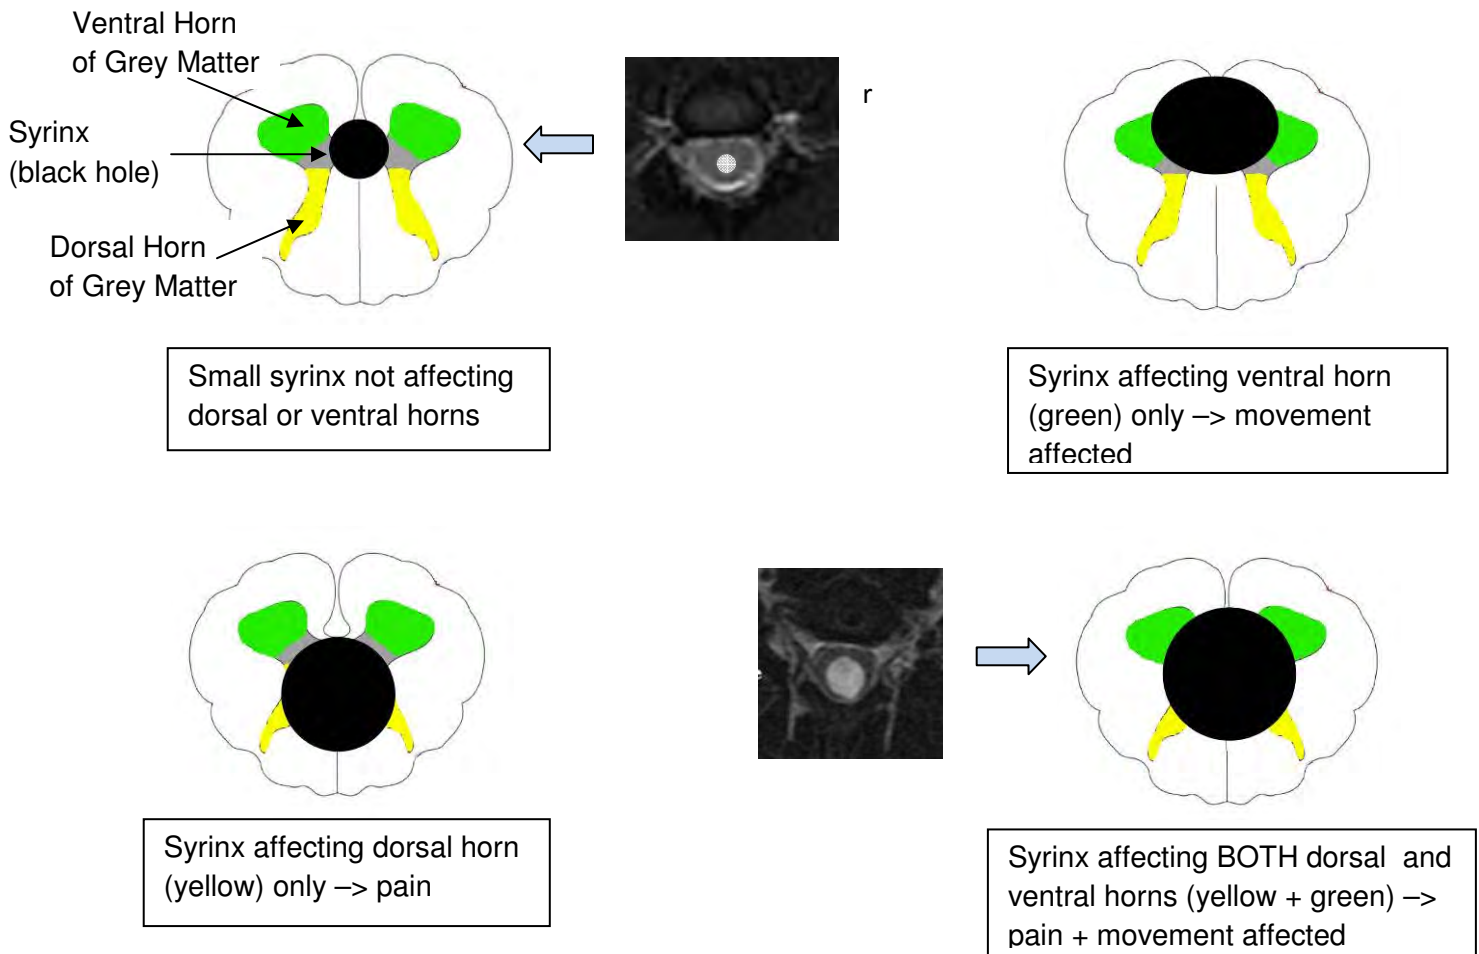

CLINICAL SIGNS

In a study by Dr. Clare Rusbridge et al ², they found that pain is related to syrinx width and symmetry. Dogs with a wider, asymmetrical syrinx are more likely to experience pain, and dogs with a small, narrow syrinx may be asymptomatic.

Ventral Horn Damage - Syrinxes that damage the ventral horn, may result in neurological deficits such as decreased spinal reflexes, muscle atrophy and limb weakness.³

Dorsal Horn Damage - Syrinxes that damage the dorsal horn of the grey matter are most likely to cause persistent pain. Dr. Clare Rusbridge also found that the larger the width of the syrinx, the more likely it was that the dog would exhibit pain and scratching behaviour.
